# Motivation

- XFEM for industrially relevant (3D) crack problems
  - Requires robust methods for stress intensity evaluation.
  - Requires low solution times and ease of use.
- but standard XEEM leads to
  - Ill-conditioning of the stiffness matrix for "large" enrichment domains.
  - Lack of smoothness and accuracy of the stress intensity factor field along the crack front.
  - Blending issues close at the boundary of the enriched region.
  - Problem size for propagating cracks ("old" front-dofs must be kept for stability of time integration schemes).

K. Agathos et al.

2015 6 / 82

イロト 不得 トイラト イラト 一日

# Global enrichment XFEM

There exists different approaches to alleviate the above difficulties:

- Preconditioning (e.g. Moës; Menk and Bordas)
- Ghost penalty (Burman)
- Stable XFEM/GFEM (Banerjee, Duarte, Babuška, Paladim, Bordas) behaviour for realistic 3D crack not clear.
- Corrected XFEM/GFEM (Fries, Loehnert)
- SIF-oriented (goal-oriented) error estimation methods for SIFs (Ródenas, Estrada, Ladevèze, Chamoin, Bordas)
- Restrict the variability of the enrichment within the enriched domain: doc-gathering, cut-off XFEM (Laborde, Renard, Chahine, Salün and the French team ;-)

K. Agathos et al.

# Global enrichment XEEM

An XEEM variant is introduced which:

- Extends dof gathering to 3D through global enrichment.
- Employs point-wise matching of displacements.
- Employs integral matching of displacements.
- Enables the application of geometrical enrichment to 3D.

K. Agathos et al.

GE-XFEM

2015 8 / 82

イロト 不得 トイラト イラト 一日

#### Related works

Similar concepts to the ones introduced herein can be found:

  - $\rightarrow$  dof gathering
  - $\rightarrow$  point-wise matching

(Laborde, Pommier, Renard, & Salaün, 2005)

- In the work of Chahine et al.
  - $\rightarrow$  integral matching

(Chahine, Laborde, & Renard, 2011)

K. Agathos et al.

イロト イポト イヨト イヨト

#### Related works

- In the work of Langlois et al.
  - $\rightarrow\,$  discretization along the crack front
  - (Langlois, Gravouil, Baieto, & Réthoré, 2014)
- In the s-finite element method
  - $\rightarrow\,$  superimposed mesh
  - (Fish, 1992)

イロト イポト イヨト イヨト

# Crack representation

Level set functions:

- $\phi(\mathbf{x})$  is the signed distance from the crack surface.
- $\psi(\mathbf{x})$  is a signed distance function such that:

$$\begin{array}{l} \rightarrow \ \nabla \phi \cdot \nabla \psi = 0 \\ \\ \rightarrow \ \phi \left( {\bf x} \right) = 0 \ \text{and} \ \psi \left( {\bf x} \right) = 0 \ \text{defines the crack front} \end{array}$$

Polar coordinates:

$$r = \sqrt{\phi^2 + \psi^2}, \qquad heta = \arctan\left(rac{\phi}{\psi}
ight)$$

K. Agathos et al.

2015 11 / 82

イロト 不得 トイラト イラト 一日

#### Crack representation

#### Tip enrichment

Enriched part of the approximation for tip elements:

$$\mathbf{u_{te}}\left(\mathbf{x}
ight) = \sum_{\mathcal{K}} N_{\mathcal{K}}^{g}\left(\mathbf{x}
ight) \sum_{j} F_{j}\left(\mathbf{x}
ight) \mathbf{c}_{\mathcal{K}j}$$

 $N_{K}^{g}$  are the global shape functions to be defined.

Tip enrichment functions:

$$F_{j}(\mathbf{x}) \equiv F_{j}(r,\theta) = \left[\sqrt{r}\sin\frac{\theta}{2}, \sqrt{r}\cos\frac{\theta}{2}, \sqrt{r}\sin\frac{\theta}{2}\sin\theta, \sqrt{r}\cos\frac{\theta}{2}\sin\theta\right]$$

K. Agathos et al.

2015 13 / 82

イロト 不得 トイヨト イヨト 二日

#### Geometrical enrichment

- Enrichment radius *r<sub>e</sub>* is defined.
- ▶ Nodal values *r<sub>i</sub>* of variable *r* are computed.
- The condition  $r_i < r_e$  is tested.
- If true for all nodes of an element, the element is tip enriched.

K. Agathos et al.

イロト 不得 トイラト イラト 一日

#### Jump enrichment

Jump enrichment function definition:

$$H(\phi) = \left\{egin{array}{ccc} 1 & ext{for } \phi > 0 \ - & 1 & ext{for } \phi < 0 \end{array}
ight.$$

Shifted jump enrichment functions are used throughout this work.

#### Enrichment strategy

Motivation for an alternative enrichment strategy:

- Tip enrichment functions are derived from the first term of the Williams expansion.
- Displacements consist of higher order terms as well.
- Those terms are represented by:
  - $\rightarrow\,$  the FE part
  - $\rightarrow\,$  spatial variation of the tip enrichment functions

K. Agathos et al.

**GE-XFEM** 

2015 16 / 82

イロト 不得 トイラト イラト 一日

#### Enrichment strategy

- In the proposed method:
  - $\rightarrow\,$  no spatial variation is allowed
  - $\rightarrow\,$  higher order terms can only be approximated by the FE part
- Higher order displacement jumps can not be represented in tip elements.

K. Agathos et al.

イロト 不得 トイラト イラト 一日

# Enrichment strategy

Proposed enrichment strategy:

- Tip enriched node
- Tip and jump enriched node

イロト 不得 トイヨト イヨト

- Jump enriched node
  - Tip enriched elements
- Jump enriched element

Both tip and jump enrichment is used for tip elements that contain the crack.

K. Agathos et al.

**GE-XFEM** 

2015 26 / 82

A D N A B N A B N A B N

3D case:

a) Point-wise matching at an edge

27 / 82

b) Point-wise matching at a face

c) Point-wise matching at several faces d) Point-wise matching at several faces K. Agathos et al. GE-XFEM 2015

Special case:

- Edge 3-4 does not belong to a tip element.
- Evaluating the tip enrichment functions at 3-4 leads to errors.
- The values obtained from edge 4-7 will be used for 3-4.

A D N A B N A B N A B N

K. Agathos et al.

2015 28 / 82

In order to implement the above procedure:

- > Point-wise matching elements are looped upon prior to the assembly.
- Parameters  $\mathbf{b}_i^t$  are computed and stored.

Parameters  $\mathbf{b}_{i}^{t}$  can be computed for all nodes.

The whole procedure is computationally inexpensive.

K. Agathos et al.

## Integral matching

Motivation:

- For P1 elements and topological enrichment a loss of accuracy occurs.
- The effect is more pronounced for mode I loading.
- This is attributed to the displacement jump between regular and tip elements.
- A possible solution is the addition of one layer of tip elements.

K. Agathos et al.

GE-XFEM

2015 30 / 82

イロト イボト イヨト イヨト

# Hierarchical functions

The addition of hierarchical blending functions is proposed.

Those functions:

- Eliminate the displacement jump in a weak sense.
- ► For linear quadrilateral elements assume the form:

$$N^{h}(\xi_{1},\xi_{2}) = rac{(1-|\xi_{1}|)(1+\xi_{2})}{2}$$

K. Agathos et al.

2015 31 / 82

イロト 不得 トイヨト イヨト

#### Integral matching

Displacements along the edges of regular and jump elements:

$$\mathbf{u}_{\mathbf{r}}(\xi_{1},\xi_{2}) = \sum_{I} N_{I}(\xi_{1},\xi_{2}) \mathbf{u}_{I} + \sum_{J} N_{J}(\xi_{1},\xi_{2}) \mathbf{a}_{J} + N^{h}(\xi_{1},\xi_{2}) \mathbf{a}^{h} \mathbf{u}_{\mathbf{t}}(\xi_{1},\xi_{2}) = \sum_{I} N_{I}(\xi_{1},\xi_{2}) \mathbf{u}_{I} + \sum_{K} N_{K}^{g}(\mathbf{x}) \sum_{j} F_{j}(\mathbf{x}) \mathbf{c}_{Kj}$$

Integral matching condition:

$$\int_{S} \left( \mathbf{u}_{\mathbf{r}} - \mathbf{u}_{\mathbf{t}} \right) dS = 0$$

Coefficients  $\mathbf{a}^h$  are obtained as:

$$\mathbf{a}_{i}^{h} = \sum_{K} \sum_{j} T_{iKj}^{h} \mathbf{c}_{Kj}$$

K. Agathos et al.

2015 32 / 82

# Integral matching

Imposition of integral matching condition:

2015 35 / 82

#### Displacement approximation

Displacement approximation for the whole domain:

$$\begin{aligned} \mathbf{u} \left( \mathbf{x} \right) &= \sum_{l \in \mathcal{N}} N_l \left( \mathbf{x} \right) \mathbf{u}_l + \sum_{j \in \mathcal{N}^j} N_J \left( \mathbf{x} \right) \left( H \left( \mathbf{x} \right) - H_J \right) \mathbf{b}_J + \\ &+ \sum_{K \in \mathcal{N}^s} N_K^g \left( \mathbf{x} \right) \sum_j F_j \left( \mathbf{x} \right) \mathbf{c}_{Kj} + \mathbf{u}^{\rho m} \left( \mathbf{x} \right) + \mathbf{u}^{im} \left( \mathbf{x} \right) \\ \mathbf{u}^{\rho m} \left( \mathbf{x} \right) &= \sum_{l \in \mathcal{N}^{s1}} N_l \left( \mathbf{x} \right) \sum_K \sum_j T_{lKj}^{t-r} \mathbf{c}_{Kj} + \\ &+ \sum_{J \in \mathcal{N}^{s1}} N_J \left( \mathbf{x} \right) \left( H \left( \mathbf{x} \right) - H_J \right) \sum_K \sum_j T_{lKj}^{t-j} \mathbf{c}_{Kj} \\ \mathbf{u}^{im} \left( \mathbf{x} \right) &= \sum_{l \in \mathcal{N}^h} N_l^h \left( \mathbf{x} \right) \sum_K \sum_j T_{lKj}^h \mathbf{c}_{Kj} \end{aligned}$$

Nodal sets:

 ${\cal N}\,$  set of all nodes in the FE mesh.

 $\mathcal{N}^{j}$  set of jump enriched nodes.

 $\mathcal{N}^{s}$  set of superimposed nodes which will be described next.

 $\mathcal{N}^{t1}$  set of transition nodes between tip and regular elements.

 $\mathcal{N}^{t2}\,$  set of transition nodes between tip and jump elements.

 $\mathcal{N}^h$  set of edges where the blending functions are added.

K. Agathos et al.

イロト イボト イヨト イヨト
A superimposed mesh is used to provide a basis for weighting tip enrichment functions.

Desired properties:

- Satisfaction of the partition of unity property.
- Spatial variation only along the direction of the crack front.

K. Agathos et al.

2015 37 / 82

イロト 不得 トイラト イラト 一日

Special elements are employed which are both:

- $\blacktriangleright$  1D  $\rightarrow$  shape functions vary only along one dimension
- $\blacktriangleright$  3D  $\rightarrow$  they are defined in a three-dimensional domain

K. Agathos et al.

2015 38 / 82

イロト 不得 トイラト イラト 一日

- A set of nodes along the crack front is defined.
- Such points are also required for SIF evaluation.
- ► A good starting point for front element thickness is *h*.

GE-XFEM1	The proposed method without the new enrichment strategy

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Influence of the crack front mesh density in the energy (E) and  $L_2$  norms.

 $n_f$  is the number of elements along the front.

K. Agathos et al.

2015 67 / 82

Influence of the enrichment radius ( $r_e$ ) in the energy (*E*) and  $L_2$  norms for the  $31 \times 61 \times 61$  mesh.

The proposed enrichment strategy improves the behavior of the solution.

```

## Stress intensity factors

Mode I, II and III stress intensity factors for the  $21 \times 41 \times 41$  mesh.

## Stress intensity factors

Mode I, II and III stress intensity factors for the 41  $\times$  81  $\times$  81 mesh.

- Conditioning of the proposed method is compared to XFEM.
- ▶ The number of iterations required by the solver is used as an estimate.
- A comparison of the time needed to solve the resulting systems of equations is also provided.
- A CG solver with a diagonal preconditioner is used.

K. Agathos et al.

イロン イ理 とく ヨン イ ヨン

## Conclusions

A method was introduced which:

- Employs point-wise and integral matching.
- Uses a novel enrichment strategy.
- Generalizes and extends the dof gathering approach to 3D.
- Is applicable to general 3D problems.

K. Agathos et al.

**GE-XFEM** 

2015 78 / 82

イロト イポト イヨト イヨト

#### Conclusions

A benchmark problem was proposed which:

- Involves a curved crack front.
- Enables the computation of  $L_2$  and energy norms for the 3D case.

K. Agathos et al.

GE-XFEM

2015 79 / 82

イロト イボト イヨト イヨト

### Conclusions

Advantages of the method:

- It improves accuracy almost in every case.
- Enables the application of geometrical enrichment in 3d applications.
- Reduces the number of additional dofs.
- Reduces computational cost in every case.

K. Agathos et al.

**GE-XFEM** 

2015 80 / 82

イロト イポト イヨト イヨト

#### Conclusions

Possible disadvantages:

- When the enrichment radius exceeds a certain value, the L2 norm increases.
- The method is not straightforward to implement in existing XFEM codes.
- The additional point wise-matching constraints are complex to implement for higher order elements.

K. Agathos et al.

**GE-XFEM**
