The idiomatic viewpoint of the European Folksongs

Computer Aided Solutions in Folksong Analysis[1]

Damien Sagrillo, IEES, Luxembourg

Study Group on Computer Aided Research, of the International Council of Traditional Music (ICTM). Jagiellonian University of Krakow, Krakow, Poland, September 1999

1. Purpose[2]

Why to split up folksongs? Folksongs are subdivided in smaller, plausible elements, the so-called 'phrases', to make comprehension of melodic courses und structures better and easier understood. The classification of theses phrases can be done independently from other structural and formal constituents of a whole folksong, for example, the form of the song, ending tones, number of phrases, etc.

In other words, the classification of a complete folksong always needs the consideration of all these components, but the selection of too many criteria can lead to confusion. The only exception: In regions like Hungary, which is very rich in folksongs, all structural and formal criteria can be considered, and these can lead to comprehensible and meaningful results, as shown by Bartok and Kodaly.

2. Preliminary Remarks

2.1 How to segment folksongs[3]

In accordance with formal principles in classical music theory the following folksong is divided in two equal parts, front part/last part (Vordersatz/Nachsatz)..

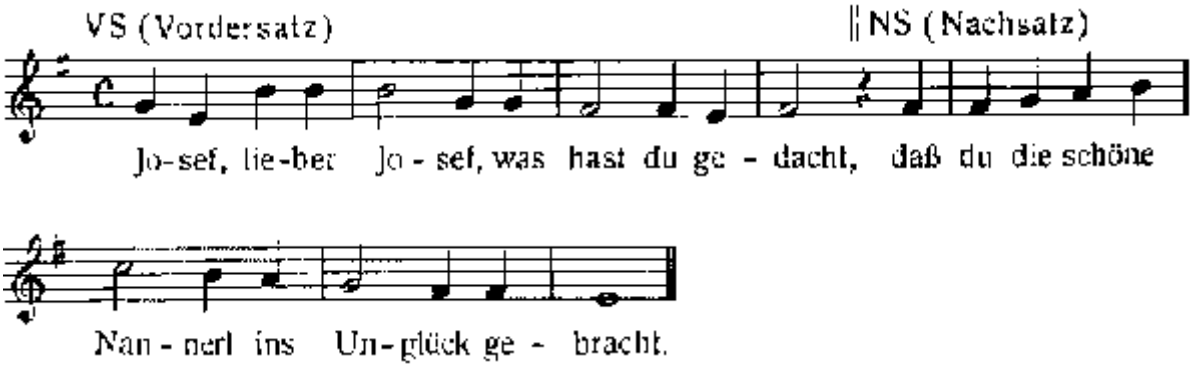

Figure 1

On the other hand, following the guidelines of modern ethnomusicology would partition this song into the four smallest possible logical segments.[4]

[2] Sagrillo, volume 1, p. 114-115

[3] Sagrillo, volume 1, p. 125-131

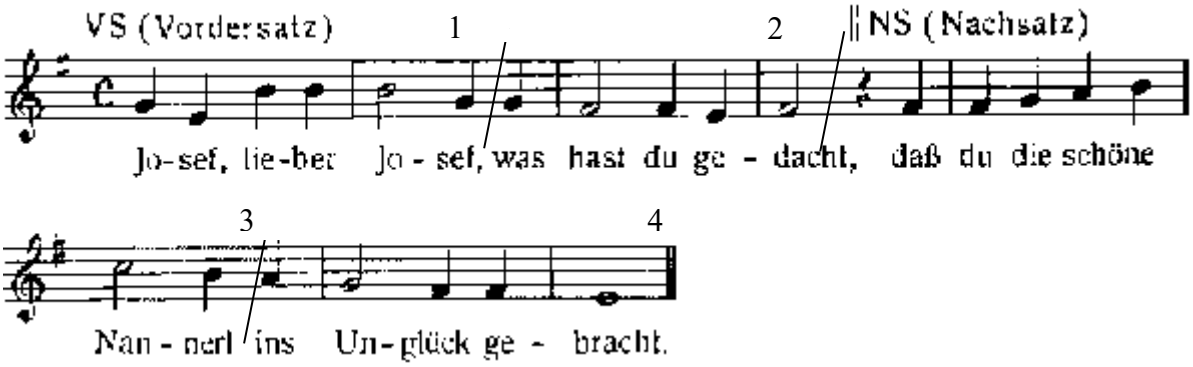

Figure 2

Exact rules for dividing a folksong into phrases of course do not exist. The folksongs codified in ESAC can be recorded by MIDI-keyboard or simply transformed manually in ASCII-format. In both cases dividing the entire folksong into phrases is obligatory. In case of doubt the textual structure could exceptionally be considered. The coded phrases are represented and manipulated with KEdit, which is an ASCII-compatible editor, with powerful sorting possibilities.

3. Methods of classifying folksong phrases using three steps

3.1 Preparation, using the catalogue of the phrases of Luxemburgish folksongs

Volume 2 of the referenced work is the so-called catalogue of phrases of Luxemburgish folksongs. It is assembled manually, so that similar phrases are sorted together and groups of variants are formed. It exists in two forms as follows;

3.1.1 The encoded form in ESAC/ASCII with the complete statistical and musical data[5].

```
KEY[Nr2671 08  G 4/4 ] MEL[554  3_.34432  6_5_0 //
CUT[K1170  207] AM[05] 2(2,6) K[05] KK[0501424]  AK[346_]
TR[55433443265//] TN[54343265 ] \
```

KEY[	The identity of the phrase, with rhythm and key indications
MEL[	The melody of the phrase
CUT[	The identity of the entire folksong
AM[	The range and the lowest and highest tone
K[	The last tone
KK[	The contour code
AK[	The stressed tones
TR[	The melody tones, repeated, but without rhythmical digits
TN[	The melody tones, not repeated and without rhythmical digits

KEY[Nr – the numerical order of the phrase in the draft version

Figure 4

3.3 Computer-Aided, Numerical Sorting[7]

Folksong phrases are sorted by Kedit using the criteria of,

1. the range (AM = Ambitus)

[6] Sagrillo, volume 1, p. 133-134

[7] Sagrillo, volume 1, p. 134-135

2. the last tone (K = Kadenzton)
3. the contour code (KK = Konturkode), a code describing the melodic course of the phrase
4. the melody of the phrase (MEL)

```
1.  MEL[+2__.+1_7_7_6_6_5__0__//]          AM[05](5,+2)   K[05]   KK[0122100]
2.  MEL[(567)+1_.+1+2+17_6_//              AM[05](5,+2)   K[06]   KK[0211112]
3.  MEL[5_6__55+1_+1_+1_+1_+1_+2_+1_7_//  AM[05](5,+2)   K[07]   KK[0411314]

Figure 5.

4 Results. Interpretation of classified folksong phrases

In the section 4.1 the structure of a catalogue of classified folksong phrases is presented. In the section 4.2 the results of this classification are illuminated. The section 4.3 briefly mentions a second study from the referenced work about formal and statistical aspects in Luxemburgish folksongs.

4.1 The Catalogue of Folksong Phrases

4.1.1 After sorting by Kedit, the first example shows the normal case, many non-similar phrases. Except for the first three lines most KEY[Rf columns are not successively numbered or random.

```
1.  KEY[Rf0120 08  G 2/4 ] MEL[-5222  123_ //]

Figure 8[10]

4.2 Interpretation of the Catalogue

The following explanation of the melodic course in Luxemburgish folksongs can of course not be exhaustive. Nevertheless the main characteristics will be explained.

4.2.1 phrases with an ending character[11]

4.2.1.1 at the end of a song

[9] Sagrillo, volume 1, p. 137
[10] Sagrillo, volume 1, p. 136
[11] 148-155

The most typical phrase with the leading tone before the tonic at the end of a song.

Figure 9

4.2.1.2 inside a song

A phrase with ending character at the end of the third phrase of a four phrase song

Figure 10

4.2.2 the leading tone (seventh degree) and its significance[12]

4.2.2.1 the leading tone inside the phrase

It exists in different forms:
the leading tone alternating with the tonic: 1-71
extension of the formula 1-71: 21-7-6-71
the leading tone rotating with the sixth degree: -6-71-6
the leading tone as seventh degree without leading function: 6765
the leading tone inside a ascending melodic line: -5-6-7123

The leading tone is accentuated in the third and the last phrase of the following song as the highest tone in the melodic course. The high tonic at the end of the third phrase has no effect on the melodic progression.

[12] 156-175

Figure 11

4.2.2.2 the leading tone at the end of the phrase

The leading tone as last tone of a phrase

Figure 12

and even as ending tone of an complete song

Figure 13

4.2.3 triad phrases[13]

Triad phrases form a very important and large part of the catalogue. Most songs make use of the main triad (135) their appearance is very varied, suborder triads are not often used. The following song is constructed largely using triads.

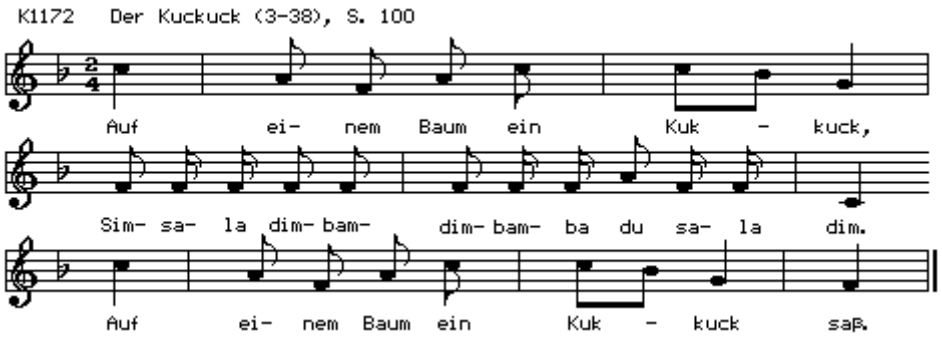

Figure 14

Three different triad figures are predominant:

Triads at the beginning of the phrase are numerous and various. They mostly commence without an upbeat.

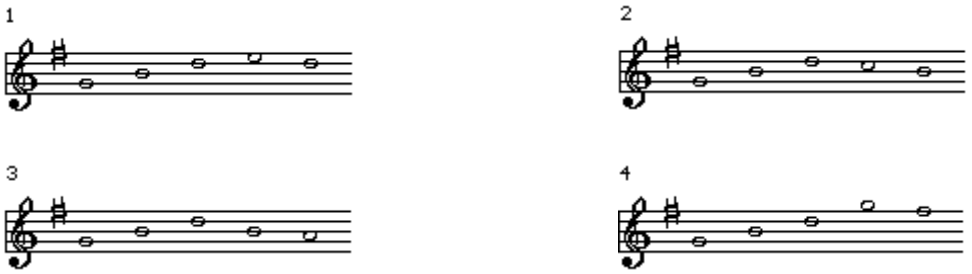

Figure 15

Frequent types of triads at the beginning of phrases with upbeat: they often begin with the lower fifth degree.

Figure 16

Triads also occur inside phrases. In this case they begin and end with one or more non-triad tones. Triads at the end of phrases consequently are preceded by one or more non-triad tones.

4.2.4 The phrase type 12345/67+165[14] is a characteristic for the folksongs of Luxembourg. It can exist together as one long phrase or as two separated, but immediately following short phrases, with or without the lower fifth degree as an upbeat.

[13] 176-204
[14] Sagrillo, volume 1, p. 205-221

Figure 17

Well-known examples; the German folksongs: *Fuchs, du hast die Gans gestohlen* or *Alle meine Entchen* or the following Luxembourg folksong from a traditional procession.

Figure 18

The short phrase 12345 often exists alone without 67+165, this one being logically anticipated by 12345. This subsequent phrase can never be found at the beginning of a song, but sometimes it can be preceded by a different opening.

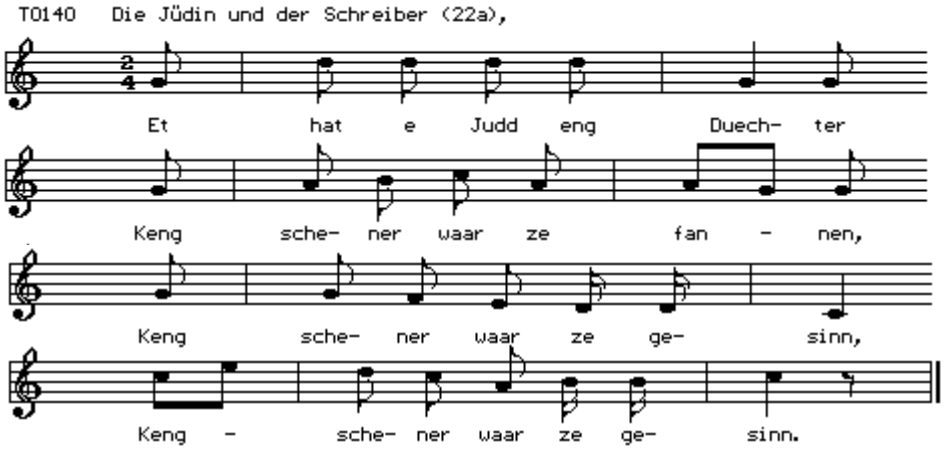

Figure 19

The sequence 1234565 with the sixth degree as culminating tone is a further intermediate variant.

Figure 20

4.2.5 About 10% of the phrases have limited ranges[15], i.e. ranges of a major third or less. The question to be answered is, whether phrases of this kind are autonomous or if they are elements of a larger melodious correlation.

4.2.5.1 The next song starts with a phrase of limited range. It is independent – it ends with the tonic – but can be considered as the starting point of the melodic progression.

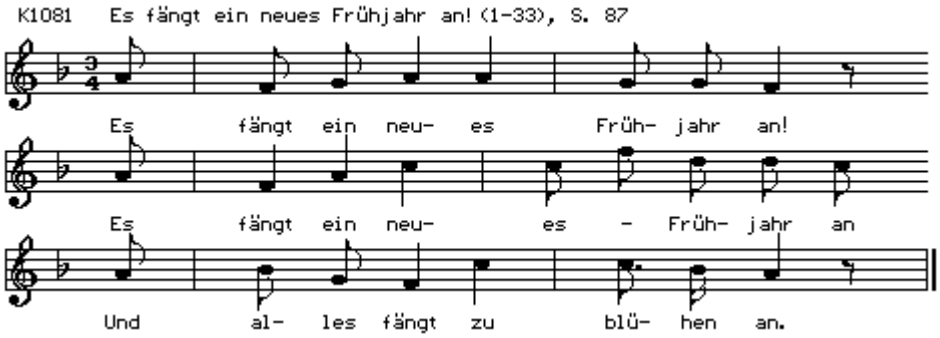

Figure 21

4.2.5.2 In contrast to this the final phrase of the following song is to be considered as a brief concluding annex.

Figure 22

4.2.6 The melodic rotation 565[16]

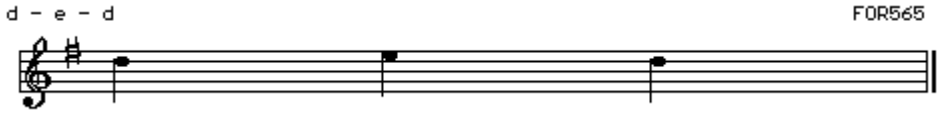

Figure 23

This melodic sequence 565 is called a rotation, because in most cases the melody turns within these limits of tone, and the average range of the phrases does not exceed a sixth.

[15] Sagrillo, volume 1, p. 222-228
[16] Sagrillo, volume 1, p. 229-246

The next chart illustrates that the melodic rotation 5-65 is most important in comparison with other possibilities of tone sequences ?-65.

Sequence	Occurrence
165	126
265	40
365	58
465	148
565	420
765	327

Figure 24

4.2.6.1 In the folksongs of Luxembourg four types of the melodic rotation 565 can be found, the melodic rotation standing alone in the phrase.

Song T0372, first phrase

Figure 25

the melodic rotation as upbeat or at the beginning of the phrase.

Song T0203, first phrase

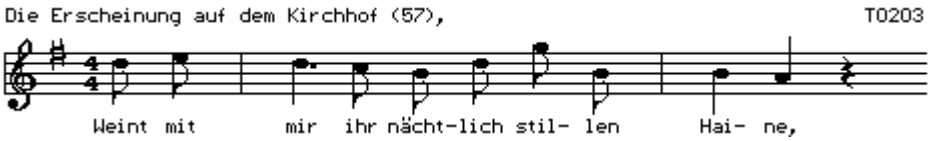

Figure 26

the melodic rotation 565 inside the phrase

Song K1130, second and third phrase

Figure 27

and the melodic phrase at the end of the phrase

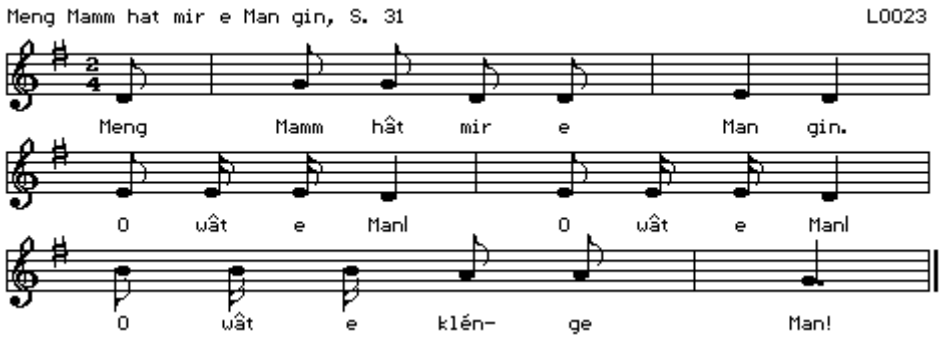

Figure 28

4.2.6.2 There exist multiple prolongations of the tone sequence 565. The next chart proves that tone connections with the sequence 5-65, i.e. beginning with the fifth degree are the most significant.

Tone Sequences	Occurrence
56543	103
_6543	147
total	**250**
5653	67
_653	95
total	**162**
56542	37
_6542	39
total	**76**
56532	7
_6532	2
total	**9**

Figure 29

4.3 Interpretation of the Formal Structures of Luxemburgish Folksongs

In the interpretation of the melodic courses formal aspects were deliberately disregarded. In a further chapter from the reference books[17], the relationship between phrases, i.e. the formal aspect, is taken into account. The form features FOT (form of pitch) and FOR (form of rhythm) of ESAC are used separately. For that reason the statements about form refer either to rhythmical or to pitch characteristics. Statements about a general form, combining rhythmical and pitch aspects cannot be assumed, because ESAC software does not support this alternative. Normally the determination of musical form depends on subjective evaluation. Attempts of interpretation with objective, rational or even mathematical computer programmes mostly lead in a blind alley.

In contrast to this, the statistical results oft the studies analysing intervals, tone degrees, rhythms and ending tones furnished by the software package of ESAC[18] are precise and satisfying.

[17] Sagrillo, volume 1, p. 247-283
[18] Sagrillo, volume 1, p. 284-297

5 Future

The reference books work on classifying folksong phrases of one region – Luxemburg – and give a broad knowledge about the individuality of Luxembourgian melodies. It would be very instructive to compare the musical language of folksongs of further regions among themselves in order to find out idiomatic particularities. Requirements: the folksongs must be comparable, and the data have to be prepared uniformally.[19]

[19] Sagrillo, volume 1, p. 315-317.
